

ABSTRACT OF THE DISCLOSURE

A device for dispensing toilet bowl treatment preparations, such as a cleaning liquid and a liquid containing a dissolved solid cleaner, from under the rim of a toilet bowl by way of the flow of water during a toilet flush is disclosed. The device comprises a bottle that holds a liquid and a base that is suspended
5 from the toilet rim and holds the bottle. The base has a piercing post for opening a closure of the bottle. A wicking device that is supported by the base conveys the liquid to a dispensing position within the flow of flush water. The container holds a dissolvable solid product, and is configured to permit flush water to enter the container. The container has an exit opening that permits a mixture of water
10 and dissolved product to be released from the container into the toilet bowl.
